BOARD BRIEF — FinTrust IDV — pre-launch board brief

System u FinTrust IDV: face-matching identity-verification ML pipeline on a public mobile-app endpoint; in-h model; downstream KYC rules engine; monthly retrain pulling from production with consent flag.

A. TOP 3 TTPS (ranked by Risk Score; tie-break by Impact)

Rank	TTP ID	TTP Name	Risk Score
1	AML.T0015	Evade AI Model — Deepfake / Generative-Liveness Bypass	20
2	AML.T0024	Exfiltration via AI Inference API	12
3	AML.T0020	Poison Training Data	10

B. RECOMMENDED CONTROLS PER TOP TTP

TTP	Recommended controls + residual risk after controls
AML.T0015 — Deepfake / Generative-Liveness Bypass	Implement active challenge-response liveness and 3D depth-sensing. Residual ris sophisticated, real-time 3D-printed masks or advanced deepfakes may still bypas though at a much higher cost to the attacker.
AML.T0024 — Exfiltration via AI Inference API	Apply strict score quantization (Match/No Match) and hard daily query caps. Res Attackers using distributed IP networks (botnets) may still extract enough data o to build a weak surrogate model.
AML.T0020 — Poison Training Data	Deploy outlier filtering on the ingestion path and adversarial canary sets before n promotion. Residual risk: A slow, coordinated poisoning campaign by a patient at drift the model slightly without triggering automated anomaly thresholds.

C. RECOMMENDATION TO THE AI REVIEW BOARD

Decision: **[Your response here — pick exactly one: Launch / Conditional Launch / No-Go.]**

Rationale	FinTrust IDV faces a Critical deepfake bypass risk (Score: 20). While the overall risk posture is mana proposed mitigation families, launching without active liveness detection invites catastrophic finan regulatory damage. We recommend a Conditional Launch: the system may go live ONLY after activ response liveness and strict API score-quantization are deployed and validated by a red-team exerc
